

Flea – Home Preparation Check List

_____ Technician Signature

_____ Client Signature

_____ Date

Yes/No

Determine with homeowner, what is the current source of the flea problem:

_____ * Indoor Pets

_____ * Indoor – Outdoor Pets

_____ * No pets present. (Meaning undetected vermin in voids of home or exterior rodents or vermin frequenting outside entrance of home.)

_____ If pets are present, confirm by documented proof the homeowner has taken the pet(s) to a veterinarian for flea bath and implemented the Frontline or Advantage Flea treatment program (or similar) on the pet(s)

_____ All floor areas (carpet and hard floors) plus upholstered furniture have been extensively and thoroughly vacuumed twice in the past 24 hours prior to our arrival. Plus the vacuum bag(s) have been discarded outside of the house immediately after.

_____ Remove all materials from floor areas under beds, furniture, closet floors to eliminate clutter and provide as much floor space access as possible for our treatment.

_____ Ensure all children's toys, pet toys, infant belongings and general clutter are all up off the floor areas throughout the entire house.

_____ Empty pet food and water dishes and place in sink or on counter.

_____ All pets with the exception of fish tanks need to be vacated from the home for at least 5 hours upon commencement of treatment. Fish tanks must be covered with a drop sheet (blanket) and the air pump(s) turned off to prevent any air born introduction of our flushing agent into the tank water.

_____ Upon our arrival we request you vacate the home and remain out for 5 hours after our completion and Lockup of the residence.

Caution:

- (A) Any flea eggs and larvae missed during your vacuuming will still hatch during the next 30-40 days. They will come in contact with our product and the veterinarians product on your pet(s) and perish quickly thereafter. Do not be alarmed and think the problem is re-occurring.
- (B) Upon re-entry open a couple windows for 15 minutes to air out the flushing agent used during the treatment.
- (C) Some floor areas could be slippery upon re-entry and will dry quickly after you open up and air-out your home.
- (D) Plug fish tank pump(s) back in and uncover tank.

Important:

- (1) Do not wash any of your floor areas for at least 3 weeks. You can do repeated damp mopping swiffering but no wet mopping or you will remove too much of our product.
- (2) No question is a stupid question! When in doubt about a concern, please give us a call to discuss.
